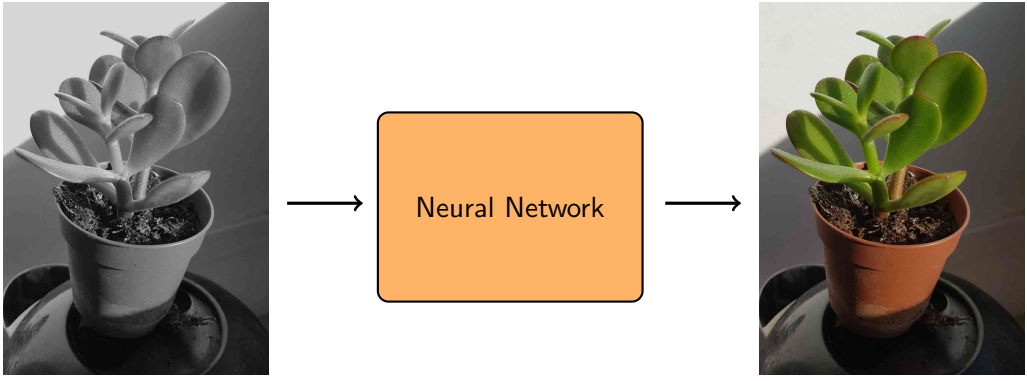
Plan

The image colorization problem

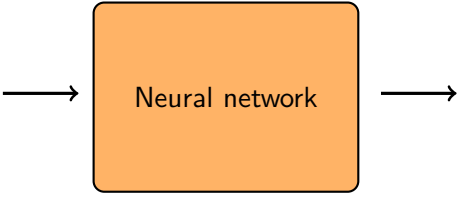


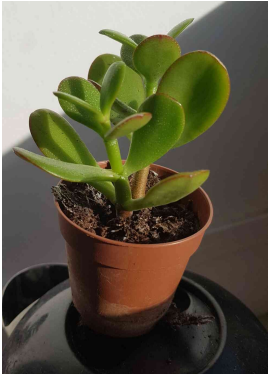
Grayscale image

Colorized image

The image upscaling problem

Low-resolution image

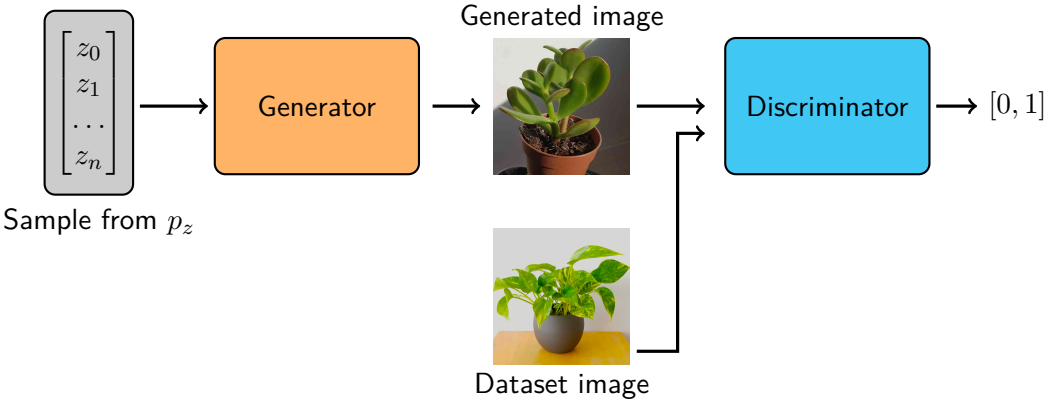




High-resolution image

Plan

Generative Adversarial Networks (GANs)



Generative Adversarial Networks (GANs)

Generation

- The generator G_{θ_G} takes a random noise vector z as input and outputs an image $G_{\theta_G}(z)$.
- The discriminator D_{θ_D} takes an image x as input and outputs a probability $D_{\theta_D}(x)$ that the image is real.
- Minimax game problem:

$$\min_{\theta_G} \max_{\theta_D} V(G_{\theta_G}, D_{\theta_D}) = \min_{\theta_G} \max_{\theta_D} \mathbb{E}_x[\log D_{\theta_D}(x)] + \mathbb{E}_z[\log(1 - D_{\theta_D}(G_{\theta_G}(z)))]$$

Generative Adversarial Networks (GANs)

Image colorization or upscaling

Change the generator to fit the colorization/upscaling problem using conditional GANs:

- Replace the noise vector z by a grayscale/lows-res image z.
- The generator G_{θ_G} takes a grayscale/lows-res image z as input and outputs an enhanced image $G_{\theta_G}(z)$.
- The discriminator receives both the enhanced image and the enhanced image (condition) as input, and outputs a probability $D_{\theta_D}(x|z)$ that the image is real.

Plan

Possible approaches

Goal: build a pipeline transforming a grayscale and low-res image into a colorized, high-res image.

Two different possibilities:

- **Two-step approach**: colorize and upscale the image using two GANs trained separately.
- **Single-step approach**: colorize and upscale the image at the same time, using a single GAN trained.

Using the LAB color space

Idea for colorization: instead of trying to learn the three RGB channels, learn only the two channels A and B of the LAB color space, given the channel L.

Idea for upscaling: learn to upscale the L channel, and use bicubic interpolation for the A and B channels.

Figure 1: Standard grayscale is very similar to the L channel

Generator model: U-Net

As a generator, we use the U-Net model, mostly used in segmentation tasks.

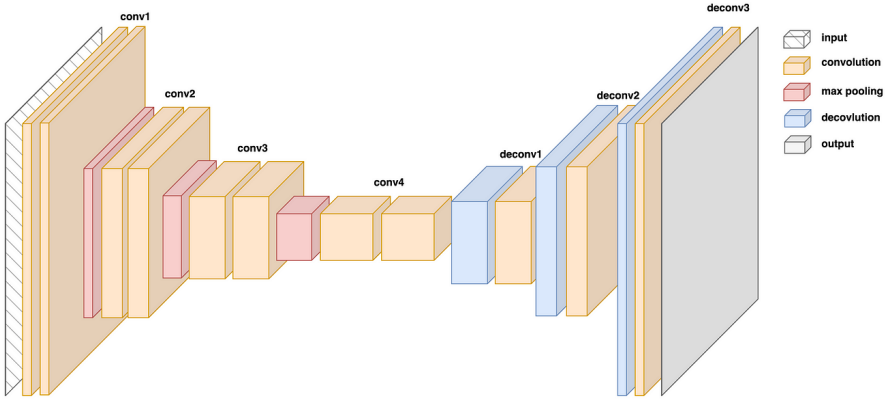


Figure 2: Architecture of the U-Net model

Plan

Results: colorization

Figure 3: Colorization results for U-Net trained on Imagenette (XX epochs)

Results: upscaling

Results: integrated approach
